It is a fully featured CRM tool. When the client connects the server is calling a web service to retrieve a JSON response. I am seeing that the webservice does not return the data until the client has been authenticated for a period of time. The webservice is written in C# and runs as a windows service. The client side is written in node.js. This is the issue: I cannot see inside the web service, and cannot manually login to the client service. I need to see what happens in the server side webservice so that I can manually login to the client web service and find the issue. I can debug the client using the Visual studio debugger on my local machine and can step through the code until the web service call is made. The service call fails and throws an exception. However, I cannot get the debugger to drop me into the client web service and see what happens. I tried setting the following in the node.js app.js: var app = require('express')(); var debug = require('debug')('myApp'); app.set('view options', { layout: false, prettyPrint: true, silent: true }); app.set('views', path.join(__dirname, 'views')); app.set('view engine', 'jade'); app.engine('jade', require('jade').__express); app.get('/', a1d647c40b

A rapid and sensitive method for the determination of antimony in potable water by solid-phase extraction (SPE) coupled with gas chromatography-mass spectrometry (GC-MS) was developed. The extracts were directly introduced into GC-MS system, and the sensitive determination of Sb(III) in potable water was achieved by selected ion monitoring (SIM). Based on the simultaneous retention of Sb and I on a XAD-2, the analytes were concentrated, and the matrix interference was eliminated. The proposed method showed good linearity, precision, and recovery. The limit of detection of the Sb(III) was 1.0 ng/L, and the limit of quantification was 5.0 ng/L. The proposed method was successfully applied to the analysis of potable water samples, and the recoveries were in the range of 86.8%-109.7% with relative standard deviation of 3.9%-9.5%. The enrichment factor of Sb was 102.1.Activation of cyclooxygenase-2 regulates the increased expression of extracellular matrix proteins and of lymphocyte chemokines in human mesangial cells treated with interleukin-1beta. To examine whether cyclooxygenase-2 (COX-2) mediates the interleukin (IL)-1beta-induced expression of extracellular matrix proteins and lymphocyte chemokines, we used specific COX-2 inhibitors (SC-236 and NS-398) in IL-1beta
